Informacja

Podane schematy są tylko niewielkim wycinkiem możliwych aplikacji urządzenia Ecumaster DET 3. Dokument ten będzie rozwijany o kolejne modele pojazdów i ich silników.

**Uwaga !**

Zamieszczone w poniższym dokumencie schematy mogą różnić się od rzeczywistych w związku z dużą ilością wersji silników i ich elektronicznego osprzętu występujących w danym modelu samochodu. W związku z tym należy przed podłączeniem urządzenia zweryfikować multimetrem i/lub oscyloskopem sygnały ECU.

Informacja

Jeżeli potrzebujesz schematu podłączenia do swojego auta i nie występuje on w niniejszym dokumencie prosimy o wysłanie wiadomości email ze schematem elektrycznym samochodu na adres: schematy@ecumaster.com

Correction #2: Disable

This configuration window allow to configure what signal will act as deflection, correction and what signal will be modified for given table.

Ignition configuration

Ignition mode: Retard / Advance 60-2 signal

This ignition mode is suitable for all cars with ignition trigger system based on toothed wheel with 58 teeth and gap with 2 missing teeth (commonly known as 60-2). It is very popular in European cars based on Bosch Motronic systems. The most common sensor used for this trigger type is VR sensor, however there are systems based on Hall sensor on the market.

Ignition input configuration

Ignition input type: VR Sensor adaptive threshold

Input mode suitable for wide range of VR sensors. Adaptive hysteresis and true zero cross detection makes this mode very immune for potential noise, however it is recommended to use shielded wires.

General

Maximum RPM: 7500	Maximum retard(deg): 15
Num signals per 720: 4	Maximum advance(deg): 15
Max RPM ever: 0	<input type="button" value="Reset RPM"/>

Max RPM - maximum rpm represented on map Y axis.
Num sig. per 720 - number of crank/cam signals per 2 engine revolutions.
Max RPM ever - maximal RPM that was recorded by device.
Reset RPM - reset maximum RPM ever value.
Maximum retard - maximum allowable spark retard.
Maximum advance - maximum allowable spark advance.

Ignition configuration

Ignition mode	Retard / Advance 36-1 signal		
This ignition mode is suitable for all cars with ignition trigger system based on toothed wheel with 36 teeth and gap with 1 missing tooth (commonly known as 36-1). It is commonly used by Ford. For older systems like EEC IV with external EDIS module, it is suggested to use EDIS SAW signal modification.			
Ignition input configuration			
Ignition input type	VR Sensor adaptive threshold		
Input mode suitable for wide range of VR sensors. Adaptive hysteresis and true zero cross detection makes this mode very immune for potential noise, however it is recommended to use shielded wires.			
General			
Maximum RPM	7500	Maximum retard(deg)	15
Num signals per 720	4	Maximum advance(deg)	15

This configuration window allow to configure what signal will act as deflection, correction and what signal will be modified for given table.

Ignition configuration

Ignition mode	Retard single signal		
This ignition mode is suitable retarding low resolution signals and signals driving ignition modules. In this mode both edges of signal are considered (e.g. proper dwell time). For ignition modules driving signals use Hall effect or optical sensor input type.			
Ignition input configuration			
Ignition input type	Hall effect or optical sensor		
Input mode suitable for wide range optical and Hall effect sensors with fixed threshold at 2.5V. This mode is also suitable for ignition module drive signals. Lots of sensors are open collector type, so input pullup is required.			
General			
Maximum RPM	7500	Maximum retard(deg)	15
Num signals per 720	4	Maximum advance(deg)	15
Max RPM ever	0	Reset RPM	
Max RPM - maximum rpm represented on map Y axis. Num sig. per 720 - number of crank/cam signals per 2 engine revolutions. Max RPM ever - maximal RPM that was recorded by device. Reset RPM - reset maximum RPM ever value. Maximum retard - maximum allowable spark retard. Maximum advance - maximum allowable spark advance.

Ignition configuration

Ignition mode: Retard single signal

This ignition mode is suitable retarding low resolution signals and signals driving ignition modules. In this mode both edges of signal are considered (e.g. proper dwell time). For ignition modules driving signals use Hall effect or optical sensor input type.

Ignition input configuration

Ignition input type: Hall effect or optical sensor

Input mode suitable for wide range optical and Hall effect sensors with fixed threshold at 2.5V. This mode is also suitable for ignition module drive signals. Lots of sensors are open collector type, so input pullup is required.

General

Maximum RPM	7500	Maximum retard(deg)	15
Num signals per 720	6	Maximum advance(deg)	15
Max RPM ever	0	Reset RPM	

Max RPM - maximum rpm represented on map Y axis.
 Num sig. per 720 - number of crank/cam signals per 2 engine revolutions.
 Max RPM ever - maximal RPM that was recorded by device.
 Reset RPM - reset maximum RPM ever value.
 Maximum retard - maximum allowable spark retard.
 Maximum advance - maximum allowable spark advance.

Frequency configuration

Frequency modification type: Modify frequency input (fuel map, linear)

This mode is used for frequency signal modification. The frequency is clamped to Freq. Max and Freq. Min value, and modified (in additive way) using Fuel Map table. Base unit is the minimal step in Hertz of modification.

Parameters

Freq. Min[Hz]	10	Freq. Max[Hz]	4000
Base unit[Hz]	1	RPM Multiplier	1.000

Ignition mode	EDIS SAW signal
---------------	-----------------

This ignition mode is suitable for FORD ignition system based on EDIS module. Ignition can be advanced or retarded by modifying SAW signal. This mode works only with Hall effect or optical sensor input type.

Ignition input configuration	Ignition input type	Hall effect or optical sensor
------------------------------	---------------------	-------------------------------

Input mode suitable for wide range optical and Hall effect sensors with fixed threshold at 2.5V. This mode is also suitable for ignition module drive signals. Lots of sensors are open collector type, so input pullup is required.

General	Maximum RPM	7500	Maximum retard(deg)	15
	Num signals per 720	4	Maximum advance(deg)	15
	Max RPM ever	0	Reset RPM	

Max RPM - maximum rpm represented on map Y axis.
Num sig. per 720 - number of crank/cam signals per 2 engine revolutions.
Max RPM ever - maximal RPM that was recorded by device.
Reset RPM - reset maximum RPM ever value.
Maximum retard - maximum allowable spark retard.
Maximum advance - maximum allowable spark advance.

Frequency configuration

Frequency modification type	Modify frequency input (fuel map, linear)
-----------------------------	---

This mode is used for frequency signal modification. The frequency is clamped to Freq. Max and Freq. Min value, and modified (in additive way) using Fuel Map table. Base unit is the minimal step in Hertz of modification.

Parameters	Freq. Min[Hz]	1	Freq. Max[Hz]	200
	Base unit[Hz]	1	RPM Multiplier	1.000

- Correction #1: Analog in #3
- Correction #2: Analog in #4

PWM Table #2:

- Load: Analog in #1
- Correction #1: Analog in #3
- Correction #2: Analog in #4

This configuration window allow to configure what signal will act as deflection, correction and what signal will be modified for given table.

Ignition configuration

Ignition mode:

- Retard / Advance multooth signal

This ignition mode is suitable for all cars with toothed wheel where the angular distance between teeth is constant and there is 4 or more teeth per engine revolution.

Ignition input configuration:

- Ignition input type: VR Sensor adaptive threshold

Input mode suitable for wide range of VR sensors. Adaptive hysteresis and true zero cross detection makes this mode very immune for potential noise, however it is recommended to use shielded wires.

General:

- Maximum RPM: 7000
- Num signals per 720: 24
- Max RPM ever: 0
- Maximum retard(deg): 15
- Maximum advance(deg): 15

Reset RPM

Max RPM - maximum rpm represented on map Y axis.
Num sig. per 720 - number of cam/cam signals per 2 engine revolutions.
Max RPM ever - maximal RPM that was recorded by device.
Reset RPM - reset maximum RPM ever value.
Maximum retard - maximum allowable spark retard.
Maximum advance - maximum allowable spark advance.

Konfiguracja #10

Ignition configuration

Ignition mode:

- Subaru trigger
- Subaru 6 tooth pattern

Ignition input configuration:

- Ignition input type: VR Sensor adaptive threshold

Input mode suitable for wide range of VR sensors. Adaptive hysteresis and true zero cross detection makes this mode very immune for potential noise, however it is recommended to use shielded wires.

General:

- Maximum RPM: 7000
- Num signals per 720: 4
- Max RPM ever: 0
- Maximum retard(deg): 15
- Maximum advance(deg): 15

Reset RPM

Max RPM - maximum rpm represented on map Y axis.
Num sig. per 720 - number of cam/cam signals per 2 engine revolutions.
Max RPM ever - maximal RPM that was recorded by device.
Reset RPM - reset maximum RPM ever value.
Maximum retard - maximum allowable spark retard.
Maximum advance - maximum allowable spark advance.

- Correction #2: Analog in #4

PWM Table #1:

- Load: Analog in #1
- Correction #1: Analog in #3
- Correction #2: Analog in #4

PWM Table #2:

- Load: Analog in #1
- Correction #1: Analog in #3
- Correction #2: Analog in #4

This configuration window allow to configure what signal will act as deflection, correction and what signal will be modified for given table.

Analog output configuration

Analog Out Min [V]: 0.20

Analog Out Max [V]: 4.80

Analog Out Offset [V]: 0.00

Force startup output voltage:

Startup Voltage [V]: 0.18

Analog signal modification step [V]: 0.0195V

This configuration window allows to configure analog output.

Analog Out Offset - constant offset addet to analog output voltage.
Analog Out Min - minimum voltage at analog output.
Analog Out Max - maximum voltage at analog output.
Startup Value - voltage at analog output at device startup.
Analog signal modification step - analog output resolution.

Konfiguracja #11

Ignition configuration

Ignition mode: Retard single signal

This ignition mode is suitable retarding low resolution signals and signals driving ignition modules. In this mode both edges of signal are considered (e.g. proper dwell time). For ignition modules driving signals use Hall effect or optical sensor input type.

Ignition input configuration: Ignition input type: Hall effect or optical sensor

Input mode suitable for wide range optical and Hall effect sensors with fixed threshold at 2.5V. This mode is also suitable for ignition module drive signals. Lots of sensors are open collector type, so input pullup is required.

General:

- Maximum RPM: 7000
- Num signals per 720: 4
- Max RPM ever: 0
- Maximum retard(deg): 15
- Maximum advance(deg): 15

Reset RPM

Max RPM - maximum rpm represented on map Y axis.
Num sig. per 720 - number of crank/cam signals per 2 engine revolutions.
Max RPM ever - maximal RPM that was recorded by device.
Reset RPM - reset maximum RPM ever value.
Maximum retard - maximum allowable spark retard.
Maximum advance - maximum allowable spark advance.
